Did you know that a quality control plan enjoys a broad range of application? Think about how you would control a paradigm shift in a business culture, modify a standard operating procedure or apply a quality control plan as a quality control manual. If you're a small company you probably don't need to rely on a documented quality control plan since you are responsible for performing the tasks that are necessary to achieve your business goals. If you're a large company then you must rely on documented quality control plans to ensure that tasks are performed on time and within the structured goals of the organization.

Did you know that you can use a quality control plan to focus attention, prevent recurrence of problems, authorize action or define the functions necessary to achieve a specific goal? You could use a quality control plan to define the responsibilities, authority, organizational interactions and procedures that are necessary for the development of a product assurance program that is applicable to a project, entire organization or a subcontractor. A quality control plan can also provide constancy of purpose.

Are you buried by a paper-driven quality management system? Could you use a **Paperless** Quality Management System?

Can your quality assurance system move information fast enough to the right people to use it as a primary quality management tool? Can you delegate process development to your quality control team knowing that the output will be a documented procedure that will show up on your task list for review when it is finished? Can you go into your total quality management system and automatically load the metrics your process owners have identified into the agenda for your management review meeting - metrics from Customer perception surveys, cost of quality or Cp Cpk Cpm statistics? Everything about the software quality assurance application is **designed to compete, not just comply,** and to eliminate the wasted activities a quality management system can add to a business. Instead of being distracted by getting your quality assurance system ready for an audit, the application keeps your company focused on meeting your Customer's needs and improves your ability to add dollars to the bottom line. **Click here** for more info...
